All G3 towers are pre-wired at Malibu. Early G3 towers had 4 wires in the tower, that was set up for a 4 channel amp. Yet we chose to continue using the 2 channel amp, so we are now running two speaker wires from the amp to the speakers and then split at the speakers for a parallel connection. Two 4 Ohm speakers in parallel pull a 2 ohm load from the amp.

Hole in Tower has grommit and shell casting with the wires crimped on back side of it.

Wires always pass thru the out side of base. Inter hole not complete.

Two speaker wires come down, to be connected to the tower amp.
